2.2 TEST SYSTEM

Instruments and materials listed below will constitute the test system but not limited to the following.

2.2.1 IDENTIFICATION OF EARTHWORMS SPECIES

- Detailed names
- Brief characteristics

2.2.1 INSTRUMENTS AND MATERIALS

- Constant temperature water bath
- Analytical weighing balance
- Thermometer
- General laboratory glassware's

Note: Details of instruments and materials used will be included in the report.

2.3 PRINCIPLE

Numbers of earthworms collected by sampling plots treated with a test substance are compared with those collected from treated negative control. Sampling is performed as specified in ISO 23611-1. The duration of the study depends on the characteristics of the test substance but is of six months duration. Sampling dates to be chosen to lie within the periods of activity of the earthworms.

The test is of a randomized block design with seven replicates per treatment. Statistical analysis of numbers of each species collected at each sampling occasion will be used to determine the effects of treatments by comparing abundance between control and treated plots.

2.4 JUSTIFICATION FOR SELECTION OF THE TEST SYSTEM

The earthworm field population is chosen as representative for the soil macro-fauna. The selection of the test is based on the requirement of: (As reference guideline and amended as per Indian requirement).

- Council Directive 91/414/EEC of 15 July 1991 concerning the placing of plant protection products on the market – J. European Communities 34; No, L230 with subsequent amendment 96/12/EC
- Guidance Document on Terrestrial Ecotoxicology. Draft Working Document SANCO/10329/2002 rev 2, final, 17 October 2002 under Council Directive 91/414/EEC.

2.5 STUDY DESIGN

2.5.1 FIELD SITE SELECTION, DESCRIPTION AND PRE-TREATMENT

The field site chosen for the test will be grassland with an earthworm density of at least 25-50 individuals/m². If in case populations of earthworms in the test field site are less, some cultured earthworms would be artificially released. The experimental field site will support a mixed population which is representative for agricultural areas.

The test site will be of known historical anthropogenic use prior to the start of the study. This shall include:

- Soil profile
- Crop and soil management
- Use of fertilizers and plant protection products within three years.

The study site will be characterized according to the following parameters with one measurement prior to the start of the test using standardized methods.

- Particle size distribution (measured in the uppermost soil layer, 0-10 cm)
- Organic carbon content (measured in the uppermost soil layer, 0-10 cm)
- pH-value (measured in the uppermost soil layer, 0-10 cm)
- Maximum water holding capacity (WHC_{max})
- Vegetation (crop)

Soil and air temperature, soil moisture, precipitation, and sunshine duration will be determined in parallel to the test item application. In addition, air temperature and precipitation recorded at the

nearest meteorological station throughout the duration of the study, the same will be summarized in the report, with details retained in the records.

Prior to application of the test item the field site will be ploughed, plot for the study will be laid out and green gram seeds known variety will be sown using a standard sowing equipment as per the regular agronomic practices followed in India.

2.5.2 EARTHWORM'S PRE-CULTURE AND RELEASE INTO SOIL

If in case the number of earthworms in identified test field is not more than 25-50 individual, a considerable cultured earthworm will be released to the test field. Preliminary culturing of earthworms (native) and amount of earthworms with organic compost are released and mixed into soil. Finally, total number of earthworms (cultured and native) is excess to 25/square meters. The cultured earthworms are *Eisenia fetida*.

2.5.3 PRE-TREATMENT OF THE TEST ITEM

The test item will be used as a water-miscible substance; therefore no pre-treatment (e.g. an auxiliary substance) will be necessary. The application solutions will be prepared shortly before the application. All application rates to be tested are based on the analyzed content of the active substance.

The test item will be dissolved in an amount of water sufficient to prepare the different application solutions. An appropriate amount of the different application solutions will be used for the application of the test item onto the soil surface using suitable application equipment.

2.5.4 METHOD OF ADMINISTRATION AND JUSTIFICATION FOR SELECTION OF THE METHOD

The test item will be applied onto to the crop as foliar application as per regular agronomic practice.

The test item will be applied using an appropriate application device which will be equipped with spray nozzles as used in agricultural practice. The test item will be applied with a water volume of 750 L/ha. The spray equipment will be calibrated prior to use. Test item will only be applied while the wind velocity is less to avoid spray drift.

To avoid any risk of cross contamination of the control plots due to possible drift the control plots beneath the treated plots will be protected by a plastic foil during application of the test item.

The test side should be irrigated, if no rainfall occurs up to three days after application of the test items to ensure exposure of the earthworms.

2.5.5 FREQUENCY AND DURATION OF ADMINISTRATION, DOSE LEVELS AND TEST DESIGN

The test item will be applied once at the beginning of the test. The test item will be tested in three application rates. The application rates of the test item are specified in agreement with the study sponsor as follows:

T1 = Water (Untreated Control)

T2 = Thiophanate methyl 70% WP @ 500 g a. i./ha (Test item), Lower recommended dose in India

T3 = Thiophanate methyl 70% WP @ 1000 g a. i./ha (Test item), Upper recommended dose in India

Base of the dose level selection: 500 g a.i./ha (the lowest level which is applied to tomato) and 1000 g a.i./ha (the highest level which is applied to cucumber and pigeons pea), the both doses are approved by Indian authorities.

A randomization procedure will be used for the location of the individual plots at the field site.

For each treatment (Control and test item two treatments three plots (= Treatments) will be installed. Each plot will have a size of at least 60 m² (10 m × 6 m). The distance between two neighboring plots will be at least 2 m.

2.5.6 CONFIRMATION OF THE AMOUNT OF TEST CHEMICALS WHICH ARE APPLIED PROPERLY INTO SOIL

Before (spray) application of test chemical solution onto soil, an amount of the solution in a tank is measured accurately. After the application, the amount in a tank is also measured. Finally, amount of application in a unit square in a field is analysed and is considered as an application dose.

2.5.7 MAINTENANCE OF TEST PLOTS

The test plots will be maintained without any further agricultural practices, i.e. no application of plant protection products or fertilizers, no harvest and no tillage until all the earthworm sampling will be completed.

2.5.8 EARTHWORM SAMPLING

At each sampling date four samples per plot will be taken and will be spaced 1-2 m from the plot border. Samples taken on the same date will be at least 2 m apart and clearly marked to assure that sampled areas will not be used for sampling at subsequent sampling dates.

Earthworms will be sampled at each sampling occasion by a combined hand-sorting/formaldehyde extraction method according to ISO 21611-1 (2005). To this end the soil of an area of 50 cm × 50 cm will be excavated by means of a spade or shovel to a depth of 20 – 30 cm and placed either on plastic sheets or in boxes. Then the soil will be carefully hand sorted and searched for earthworms. During the hand-sorting procedure, in order to approach earthworms beneath the excavation depth, a solution of formaldehyde (0.2%) will be applied uniformly at a rate of 5 – 10 liters/0.25 m² to the same plot from which the top soil has been removed for hand-sorting done. The formaldehyde solution will be poured within the excavated hole in 2 to 3 portions according to the seepage capacity of the soil. The total duration of the extraction will be approx. 30 min. The earthworms collected by hand-sorting and the formaldehyde extraction respectively will be collected in separate watertight containers and will be preserved in ethanol until identification.

2.5.9 SAMPLING DATES

Earthworm samples will be taken in the following order:

Pre-sampling: 1-4 weeks before application of the test item

1st sampling: about 1 month (30 Days) after application

2nd sampling: about 3 months (90 Days) after application

3rd sampling: about 6 months (180 Days) after application (Only if required)

2.6 EXPERIMENTAL PROCEDURE

Chronological description of the test performance including methods used:

2.6.1 PREPARATION OF THE TEST

- A grassland site will be identified and selected as the test site.
- The site will be characterized with regard to soil type, vegetation and earthworm species and distribution.
- Prior application of the test item the field site will be ploughed and green gram will be sown (variety and amount site specific).
- 21 plots (3 plots per treatment), each plot at least (10 m x 6 m) will be identified and the test treatments (test item and control) will be assigned to the test plots in a randomization procedure.

2.6.2 FIELD WORK

- Approximately 1-4 weeks prior to application of the test item earthworm pre-sampling will be conducted. The pre-sampling will be performed similarly to the samplings after application.
- The application of the test item will be done, the date of application of the test item is strongly depending on the weather conditions and likely to deviate from the proposed time schedule. The actual date of application will be decided by the study director and will be reported in the study report.
- Immediately prior to application, application solutions of the test item will be prepared in the field.
- Test item and control treatments will be applied to the respective plots (3 replicate plots per treatment).
- Immediately after application of the test item soil samples will be taken for chemical analysis of test item concentration in soil.
- If no or little rainfall occurs within 3 days after application, the plots will be irrigated to achieve a total of approximately 10 mm (rainfall plus irrigation).
- Depending on the weather conditions approximately one month after application of the test item 1st earthworm sampling.

- Depending on the weather conditions approximately three months after application of the test item 2nd earthworm sampling.
- Depending on the weather conditions approximately six months after application of the test item 3rd earthworm sampling will be done only if required.

2.6.3 DATA ASSESSMENT AND STATISTICAL EVALUATION

Each sampling occasion will be evaluated separately.

- Abundance: Mean number individuals per treatment, calculated in total.

Comparison between test item treatments and control will be made using suitable statistical methods. An ANOVA followed by a t-test (e.g. Williams or Dunnett's test; $p=0.05$, 1-side smaller) will be used in case of normal distributed and homogenous data to determine statistically significant differences compared to the control. In case of normal distributed but non-homogenous data a t-test for non-homogenous variances, whereas in case of not normal distributed and non-homogenous data a non-parametric U-test will be used. Normal distribution will be tested by e.g. Komogorrof- Smirnov-test ($\alpha=0.05$) and homogeneity of the variance will be tested by e.g. Bartlett's test ($\alpha=0.05$). If possible, the EC_{50} will be estimated by applying linear regression models, e.g. Probit analysis or other regression models. The method chosen will be recorded.

2.7 VALIDITY CRITERIA

The following criteria shall be satisfied for a test results to be considered valid:

- mean earthworm density in the control plots at least at one sampling date: > 25 to 50 individual/m²
- Statistically significant effects of at least 50% on overall abundance compared to control at least at one sampling date.

3. REPORTING

- a graphical representation of the abundance during the test period;
- any operating details not specified in the Guidance, as well as any factors that may have affected the results;

4. AMENDMENTS / DEVIATIONS

Changes to this Study Plan may be made as the study progresses. Study Plan amendments for all such planned changes will be signed by the Study Director and the copy will be provided to the Sponsor. If immediate action is necessary verbal agreement with the Sponsor will be confirmed as soon as possible by Study Plan amendment.

All Study Plan deviations will be noted in the study records and will be presented in final report. Any study related deviations will be documented in raw data file and acknowledged by Study Director during conduct of study.

5. ARCHIVES

The following material shall be retained in the Archives of Testing Lab/Test Facility, for a period of one year, starting from the date of submission of final report.

List of Archived Material:

All Raw Data, the Study Plan, the Final Report and samples of Test Item.

At end of above retention period, the necessity of a further period of archiving and its location shall be discussed with the Sponsor and decided on renewed terms.
