	<p>RC deliberated the agenda after the presentation made by the applicant M/s Shogun Organics Ltd. in Compliance of the order dated 24.03.2022 passed by the Hon'ble Appellate Authority in their appeal no. 13 of 2021.</p> <p>It was observed that the applicant has submitted all the toxicological studies data of Renofluthrin Technical and Renofluthrin 0.025 % w/w mosquito coil formulation (and also toxicity data on Renofluthrin 5% MUP vide F. No. 5828-F/9(3)/2015-CIR-II under agenda item no. 6.17 of 439th RC meeting) as per the guidelines of CIB&RC except sub-acute oral toxicity study in dog and metabolism study in livestock, and has requested to waive off these two studies for grant of registration. The agenda was discussed at length and RC decided to grant registration allowing waiving off the two toxicity studies (subacute oral toxicity in dog and metabolism in livestock) on the basis of the following justifications:</p> <p>The external expert in the report has mentioned that Laboratories have refused to conduct dog study, as per the reference given on page 1907 of folder No. 6, as well as a letter dated 9th June 2017 of the applicant regarding exemption of dog study by giving reference of Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA). Further, in the minutes of 336th RC meeting under agenda item no. 9.14, held on 01.03.2013, the Committee</p>

	<p>had deliberated the agenda in detail and decided to waive off the data for subacute oral toxicity study in dog on Paclobutrazol technical, however, applicant was required to submit the toxicity data on livestock. It was also deliberated that the intended use of Renofluthrin is for household mosquito control with a very low concentration of a.i. and the health monitoring study conducted by the applicant on the Human Volunteers on mosquito coil formulation in the present study showed no adverse effects. The safety margin have been calculated and found to be 79214285 times which is very high and very safe for human beings (including pregnant women and children), animals and the environment.</p> <p>The applicant has also submitted toxicity study in livestock. It has been pointed out that when a study on livestock is provided then a study on dog can be extrapolated, as both are higher mammals. The external expert has opined that conducting toxicity study in dog is a tedious task and dog is also a very sensitive species. Further, it is cumbersome to rehabilitate a dog in case test animal is not sacrificed at the end of toxicity study. Further, this aspect has been critically evaluated and thoroughly examined by the concerned toxicology expert which also confirms that the dog study can be considered for waiver in view of the facts as above in this case.</p> <p>RC also deliberated in detail regarding waiver off the metabolism study in livestock. It has been clearly confirmed and further stated by both the external expert and the concerned toxicology expert that the test molecule Renofluthrin is an ester macromolecule produced by reaction of an acid and an alcohol by cross combination of Transfluthrin and Metofluthrin which are already registered in India and their toxicology data including metabolism is known. The concept of Bridging (Read-across) is thus fully applicable and can be extrapolated in this study too, as it being an exceptional case where constituent acid and alcohol moieties are matching with the registered molecules and are experimentally proved. The metabolites M1, M2 and M3 identified in the oral pharmacokinetic study data in rat in Renofluthrin, are similar to the metabolites reported in the metabolism study of Transfluthrin and Metofluthrin. Therefore, metabolism study in the livestock is not considered essential in the present case.</p> <p>Based on the above justifications and detailed discussion, RC decided to allow the waiver of dog study and metabolism study in livestock in this particular case. However, it was also decided that this will not be taken as a precedent later on and each case will be decided on its own merits.</p> <p>So, after due deliberations, RC approved for grant of registration of Renofluthrin 0.025 % w/w mosquito coil formulation for indigenous manufacture u/s 9(3) of the Insecticides act, 1968 under FIM category without registering technical.</p>
<p>6.17</p>	<p>Follow up action for consideration of application M/s Shogun organics Ltd., as the decision of 437th RC meeting vide agenda item no. 10.49 for grant of registration of <i>Renofluthrin 5% MUP u/s 9(3)</i>.</p>
	<p>RC deliberated the agenda and approved for grant of registration for indigenous manufacture of Renofluthrin 5% MUP u/s 9(3) of the Insecticides act, 1968 under FIM category without</p>

 - d) Undertaking on NJSP duly notarized that product is free from chemical /botanical pesticides / other agro-chemicals.
 - e) Affidavit of strain Innovator or applicant
 - f) Copy of 9(3B) Registration certificate, if relevant

Note:

1. Bt products should be labelled with bio potency and (or) toxin content. In addition, the labels will have to contain a measurement of toxin protein as percent protein, referring to the Lepidopteran-active toxin(s) present in the crystal.
2. The presently used Bt var. kurstaki standard is HD-1-S-1980 and its potency was calculated at 16,000 IUs per milligram of powder (Beegle et al. 1986. Standardization of HD-1-S-1980: US Standard for Lepidopterous-active *Bacillus thuringiensis*. Bulletin Ent. Soc. America 32: 44-45.). This standard strain is now available with PDBC, Bangalore and DOR, Hyderabad.
3. Defined potency and toxin concentration – Bioassay would require the use of an insect species. Normally manufacturers could select *Trichoplusia* / *Helicoverpa armigera* for Lepidopteran specific Bt formulations. *Spodoptera* Units (SPU), *Leptinotarsa* Units (LTUs) or International Toxin Units (ITUs) are to be used for denoting a specific insect.
4. No test for beta exotoxin is required for *Bacillusphaericus*, because this species is not known to produce exotoxins.
5. The biopotency of products based on *B. thuringiensis* subsp. *israelensis* (*Bti*) is compared against a reference strain IPS82, 1884 using early fourth-instar larvae of *Aedesegypti* (strain Bora Bora). The toxicity of IPS82 has an arbitrarily assigned toxicity of 15,000 ITU/mg powder.

6. The biopotency of products based on *B. sphaericus* (*Bsh*) is determined against a reference standard SPH88, strain 2362 using early fourth-instar larvae of *Culex pipiens* (strain Montpellier). The toxicity of SPH88 has an arbitrarily assigned toxicity of 1,700 ITU/mg of the powder (Guidelines for laboratory and field testing of mosquito larvicides, WHO 2005 pp 45).
7. The use of alternative bacterial reference powders and / or strains must be approached cautiously. Such alternatives must be the subject of careful cross-calibration against the reference powders and should be conducted by recognized laboratories and should be made available to anyone who wishes to use, or check, the test with the alternative powders/strains.
8. Water content should not exceed 8 %, (12% in *Pseudomonas spp*) to preclude premature degradation of the product.

Guideline for already registered formulation/Strain u/s 9(3) under the IA, 1968.

Applicant shall submit only one folder containing the following documents:

Besides this the sub-committee also propose the draft Guidelines on consortium of Bio-pesticides.

Draft Guidelines on Consortium of Bio-pesticides.

Efficiency of biocontrol agents could be increased by the development of mixture of compatible strains of different biocontrol organisms by considering the following norms. While developing a consortia formulation, the following needs to be addressed:

1. Compatible strains combination that differs in pattern of plant/site of colonization.
2. Compatible strains combination is broad spectrum of action against different plant pathogens.
3. Compatible strains combination with different modes of action under similar conditions.
4. Compatible strains combination of genetically diverse group to adapt to different pH, moisture, temperature and relative humidity.

The guidelines of Chemistry, Bio-efficacy, packaging for registration of consortia of Bio-pesticides are similar with the guidelines of Bio-pesticides except the following points.

Guidelines of mother culture/Primary culture of already registered bio-pesticides u/s 9(3) category are not required for registration of consortium Bio-pesticides. Only the guidelines of formulated product (Consortium) will be required. **Ratio of each strain in the formulation is required.**

1. Following toxicology guidelines for consortia of Bio –pesticides is required.

Note:

- a -Inhalation toxicity study required for registration of entomopathogenic/entomotoxic bacteria
- b -Pulmonary toxicity study required for registration of antagonistic bacteria, antagonistic fungi, entomopathogenic fungi, baculovirus
- c -Intraperitoneal toxicity study required for registration of antagonistic fungi, entomopathogenic fungi, antagonistic bacteria
- d - Cell culture and Intravenous study required for registration of baculovirus.
- e and f – required for all except antagonistic fungi
- g- required for all except entomopathogenic/entomotoxic bacteria

Note:

- If genome sequence of conserved region of the microbial strains/microbes which are used in consortia of Bio-pesticides to be used as microbial pest control agent is identical with already registered strain, then data is not required for mother culture but data is required for combination/consortia from toxicity angle.
- If any new formulation of microbes is made by using new ingredients with different processes of manufacture than data is required for the formulation.
- If any new combination/consortia /Mixture of microbial strains/microbe developed from already registered microbial strain than data is required only for the mixture and not for mother cultures from toxicity angle.

- 6.4 Bioassay procedure based on diseased severity and root colonization as detailed in Appendix-I

Appendix-I

Bioassay for plant disease antagonists based on disease severity and root colonization.

The target pathogen to be tested against has to be grown in Sand maize medium. The Sand-maize medium is prepared by adding sand 90g, maize 10g. and water 10ml in a saline or any glass bottle of 300ml capacity and then autoclaved twice. Then 5 mycelial discs of the test

pathogen are transferred into the bottle and left for incubation for 15 days. Once the culture has grown well, the sand maize medium is mixed along with the fungal growth and 1g from this preparation is used as the inoculum after adjusting the cfu to 1×10^6 by addition of sand.

The plastic cups (5-6 cm diameter) filled with soil and FYM (3:1) have to be used. In each cup the filling should be done upto $\frac{3}{4}$ th level. The pathogen inoculum is mixed with sand has to be applied upto 2cm depth in the plastic cups.

The bioefficacy of the bioagent shall be tested by both seed treatment and soil application. For seed treatment, the recommended dose of the formulation has to be used (5 to 10g.). For soil application, the bioagent is added at the rate of 1g of formulation (minimum cfu should be the 2×10^6). The germination percentage, disease intensity and seedling vigour are to be recorded.

Another set of plastic cups filled with sterile soil and sterile FYM has to be used to confirm whether the bioefficacy was due to the isolate of the bioagent tested or due to the native isolates of the bioagent present in the soil.

The keys for grading the efficacy mentioned below shall be used (Srivastava et al., 2002). However, for the registration purpose, the bioagents that are Highly Efficient, Efficient or Moderately Efficient in the plastic cup test under glass house condition (in the presence of pathogen) can be allowed (i.e.) germination percentage of 70% or above, disease incidence of 30% or less can be considered for registration.

Disease Grading Key

Disease incidence (%)	Description	Rating of bioefficacy of bioagents
0	Germination >90%, no seed rotting, seedling healthy, root and shoot portions well developed	Highly Efficient (HE)
1-15	Germination 80-90%, infection on main as well as lateral	Efficient (E)

	roots, seedlings are well developed	
16-30	Germination 70-80%, development of roots restricted and growth is less compared to Score 1. Infection occurred on roots. Shoot portions developed but growth retarded compared to Score 1.	Moderately Efficient (ME)
31-45	Germination 60-70%, length of roots and shoots short compared to Score 1. Germination of seeds inhibited. 50% of root area infected. Shoot portions also showed infection	Moderately Inefficient (MI)
46-60	Seed germination 50-60%. Development of roots and shoots greatly retarded. Shoot portions also showed infection.	Efficient (I)
Above 60	Less than 50% germination and seed rotting	Highly Inefficient (HI)

For the root colonization assay, the rhizosphere region of the plants tested above have to be collected and the soil adhering to the root surface has to be removed by gently tapping the roots. The root bits have to be cut into 1 cm bits and randomly 25 bits should be selected for each treatment. They have to be plated on (TSM) and the percentage of root bits colonized has to be recorded. This has to be performed in the sterile soil and non sterile soil. One control treatment without the Biocontrol agent, being tested, should be kept for both the sterile and non-sterile soil to rule out of the possibility of interference of native micro flora in the bioefficacy assay.

APPENDIX- I

Bioefficacy assay for plant disease antagonists based on disease severity and root colonization:

The pathogen to be tested against has to be grown in sand maize medium. The sand-maize medium is prepared by adding sand 90g, maize 10g and water 10 ml in a saline or any glass bottle of 300ml capacity and then autoclaved twice. Then 5 mycelial discs of the test pathogen are transferred into the bottle and left for incubation for 15 days. Once the culture has grown well, the sand maize medium is mixed along with the fungal growth and 1 g from this preparation is used as the inoculum after adjusting the cfu to 1×10^6 by addition of sand.

The plastic cups (5-6 cm diameter) filled with soil and FYM (3:1) have to be used. In each cup the filling should be done upto $\frac{3}{4}$ th level. The pathogen inoculum is mixed with sand has to be applied upto 2 cm depth in the plastic cups.

The bioefficacy of the bioagent can be tested by both seed treatment and soil application. For seed treatment, the recommended dose of the formulation has to be used (5 to 10g). For soil application, the bioagent is added at the rate of 1g of formulation (minimum cfu should be the 2×10^6 , the CIB recommended dose). The germination percentage, disease intensity and seedling vigour are to be recorded.

Another set of plastic cups filled with sterile soil and sterile FYM has to be used to confirm whether the bioefficacy was due to the isolate of the bioagent tested or due to the native isolates of the bioagent present in the soil.

The keys for grading the efficiency mentioned below can be used here (Srivastava et al., 2002). However, for the registration purpose, the bioagents that are Highly Efficient, Efficient or Moderately Efficient in the plastic cup test under glass house condition (in the presence of pathogen) can be allowed (i.e.) germination percentage of 70% or above, disease incidence of 30% or less can be considered for registration.

Disease Grading Key

Disease incidence (%)	Description	Rating of bioefficacy of bioagents
0	Germination >90%, no seed rotting, seedling healthy, root and shoot portions well developed	Highly Efficient (HE)
1-15	Germination 80-90%, infection on main as well as lateral roots, seedlings are well developed	Efficient (E)
16-30	Germination 70-80%, development of roots restricted and growth is less compared to Score I. Infection occurred on roots. Shoot portions	Moderately Efficient (ME)

	developed but growth retarded compared to Score I.	
31-45	Germination 60-70%, length of roots and shoots short compared to Score I. Germination of seeds inhibited. 50% of root area infected. Shoot portions also showed infection	Moderately Inefficient (MI)
46-60	Seed germination 50-60%. Development of roots and shoots greatly retarded. Shoot portions also showed infection.	Inefficient (I)
Above 60	Less than 50% germination and seed rotting	Highly Inefficient (HI)

For the root colonization assay, the rhizosphere region of the plants tested above have to be collected and the soil adhering to the root surface has to be removed by gently tapping the roots. The root bits have to be cut into 1 cm bits and randomly 25 bits should be selected for each treatment. They have to be plated on TSM and the percentage of root bits colonized has to be recorded. This has to be performed in the sterile soil and not sterile soil. One control treatment without the biocontrol agent being tested should be kept for both the sterile and non-sterile soil to rule of the possibility of interference of native microflora in the bioefficacy assay.

For the bacterial antagonists, the above bioassay procedure has to be followed where only the % root colonization will be considered and other parameters are not required. The % root colonization required is 80%.

Insect pathogens:

Beauveria bassiana*, *Metarhizium anisopliae*, *Nomuraearileyi

Preparation of Fungal inoculum for bioassays:

The fungus is grown on SDAY/SMAY medium for 10 days in slants and aqueous spore suspensions of various concentrations are prepared using sterile water. The spore count is estimated by Haemocytometer. (10^4 - 10^{10} spores/ml). Tween-80 is added @ 0.01% to get uniform spore suspension.

Rearing insects:

H.armigera*, *S.litura - Artificial diet (Semi-synthetic diet)

Stage of insect for bioassay

H.armigera*, *S.litura - II instar larvae to be used for bioassay protocols for lepidopteron pests

Method of inoculation

S. litura

1. Cut castor leaf discs of 3.0cm diameter, rinse in sterile distilled water and place each leaf disc in a sterile Petri plate and allow it air dry in a laminar flow system
2. Apply ten micro liters of the spore suspension of each concentration on the leaf disc and spread it uniformly on the leaf surface and allow it air dry in a laminar flow system. Treat the other side of the disc similarly.
3. Release ten numbers of second instar larvae of *S. litura* on the leaf surface and incubate the discs in an incubator at 25⁰C and 90% RH
4. After 24hours, shift the larvae to the polypots containing the semi-synthetic diet and incubate in an incubator at 25⁰C and 90% RH
5. After 5 days of incubation, mortality of the larvae are recorded in each concentration tested
6. Lc-50 can be calculated using SPSS package

Standard for LC-50: Not more than 2.00×10^6 spores/ml (3.0×10^3 spores/mm²)

H. amigera:

Instead of castor leaves, soybean leaves can be used for *H. amigera* and the procedure is same as above.

Standard for LC₅₀: Not more than 4.00X10⁶ spores/ml (6.0X10³ spores/mm²)

Appendix-II

Bioassay procedure for *Plutellaxylostella*

Various concentrations of *Beauveria bassiana* formulation ranging from 6 x 10⁸ to 2 x 10¹⁰ are to be screened to assess the mortality.

Fresh undamaged radish leaves free from pesticide application are to be collected and washed thoroughly in sterile distilled water and air-dried. Individual leaves are dipped in respective concentrations for 30 seconds. After complete drying of leaves ten late 2nd instar larvae of *Plutellaxylostella* are released per treatment. A water dipped radish leaf is maintained simultaneously as control.

To prevent desiccation of leaves, the petiole is covered with a moist cotton swab. Each treated leaves are placed in a plastic container of dimension 12.5 x 10 cm containing moist filter paper, Whatman No.41 to provide humidity.

Each treatment has to be replicated thrice. Fresh radish leaves were provided as feed at 24 hours interval. This set up has to be maintained at 25±1^oC and 70-80% RH for 7 days. Observations on larval mortality are to be made at 3, 5 and 7 days after treatment.

Standard for LC₅₀= Not more than 3 x 10⁹cfu/g

Appendix I**Bioassay Method****Diet incorporation**

The following protocol is used for diet incorporation of oral toxicants to test their toxicity on target insects. The example presented here is to bioassay Cry I Ac on *H. Armigera* (First instar larva of other test insects are used for similar bioassay).

1. Pipette out 3 ml of the solution into a 40 ml plastic cup.
2. Pour lukewarm diet, approx. 60^o C, into the cup to a total volume of 30 ml. Place the lid and shake the cup vigorously for a minute to mix properly.
3. Pour the diet to 0.5 cm height, into wells of a 24-cell insect- rearing tray. Allow the diet to cool in laminar airflow under UV lamps for 1 h to surface sterilize the diet.
4. If concentration of the toxicant in the stock solution was 2 µg/ml, the final concentration in the diet would now be 0.2µg/ml diet. Thus the final concentration of toxin in diet was diluted 10-fold.
5. Release first instars into the diet rearing trays at the rate of one per well. Cover the diet tray with semi-permeable wrap and close the lid.
6. It is recommended that the lid be tightly secured to the tray with rubber bands, to prevent the larvae from escaping. Because the diet is unsuitable, larvae try constantly to escape from the diet rearing trays.
7. Keep controls with larvae released on untreated diet, for all the experiments.
8. The unused rearing trays with diet can be stored in a refrigerator for a week.
9. Change the diet for the larvae every two or three days.
10. Record mortality observations at 8 hourly intervals until the end of seven days, for median lethal time LT₅₀ calculations. LT₅₀ is the time at which 50 % of the test population is killed with the specific dose tested. A simple linear regression equation can be worked out to calculate the LT₅₀
11. Otherwise, record mortality at alternate days until the end of seven days, for median lethal concentration LC₅₀ calculations. LC₅₀ is the concentration that kills half the test population.
12. Record weights of surviving larvae at the end of seven days, for median effective concentration EC₅₀ and LC₅₀ is the concentration that prevents half the test population from reaching 50% of the weight attained by control larvae. For example, if the average weight of larvae on the control diet (without toxin) was 80 mg, EC₅₀ represents the concentration at which 50% of the test population is unable to gain a weight more than 40 mg. LC₅₀ is the concentration that inhibits half the test population from reaching the third instar.

Diet incorporation for filter paper bioassays

1. For bioassays with bollworms, 10 ml toxin incorporated diet is poured over a 16sq cm piece of filter paper. The filter papers layered with diet are cooled and cut into smaller squares of 2 x 2 cm, and 10 first instar larvae are released in small plastic cups 3 x 3 cm (d x h) cups containing a square. Change the strips every alternate day.
2. Record mortality observations until the seventh day.

Surface coating of semi-synthetic diet

1. Prepare the diet and pour it into the trays or the rearing plastic cups. Generally, 10 µl of the toxin can be used to coat 1 sq cm surface area. Gently swirl the diet surface to ensure uniform and complete spread of the solution over the diet surface.
2. Allow the surface to dry in a laminar airflow under UV light for 2-3 hours to surface sterilize.
3. Release one first instar *H. armigera* larva per well. Always maintain proper controls with untreated diet.
4. Change the diet on alternate days and record mortality until the seventh day. Then, weight of surviving larvae should be recorded on the final day of the bioassay.

The method has the advantage of obtaining constantly reliable results because the toxin is unlikely to be affected by either improper mixing or heat as can occur in the diet-incorporation method. Moreover, less amount of the toxin is required for the assay, compared to the diet-incorporation method.

Exotoxin determination by PCR studies

Methodology:

Some *Bacillus thuringiensis* strains secrete type I β - exotoxin, which is a non-specific insecticidal and thermostable adenine nucleoside oligosaccharide. Toxicity bioassays and HPLC are traditional methods for detecting β -exotoxin. For rapid approach for prediction of type I β -exotoxin production, PCR-based method can be followed as per Diego H Sauko *et al.* (2014). One of these ORFs encodes the Exo protein that was proved to be responsible for the phosphorylation of a β -exotoxin precursor at the last step of their biosynthesis process (Liu *et al.*, 2010). Primers BEF (forward; 50- CGGCAGCCGTTTATTCAAA-30) and BER (reverse; 50- CCCCTTCCCATGGAGAAACA-30) amplify a 406-bp DNA fragment of *thuE* between nucleotides 373 and 778. All *B. thuringiensis* strains are grown on nutrient agar plates for 16h. A loopful of cells is transferred to 100 μ l H₂O and boiled for 10 min to make DNA accessible for PCR amplification. The lysate is centrifuged briefly (5 s at 20,000g), and 5 μ l supernatant is used as a DNA template in each polymerase chain reaction. This is performed with a final volume of 25 μ l containing 2.5 μ l 10x reaction buffer, 0.5 μ l 50 mM MgCl₂, 0.5 μ l 100 mM deoxynucleoside triphosphate mixture, 8 pmol each primer, and 1 U of Taq polymerase (Invitrogen). The PCR amplification consisted of DNA denaturation at 94°C for 2 min followed by 25 cycles of amplification with a gradient thermocycler. Each cycle consisted of a denaturation step at 94°C for 1 min, an annealing step at 54°C for 1 min, and a chain elongation step at 72°C for 1 min. The final elongation step was extended for an additional 5 min. Subsequently, 10 μ l PCR product is analysed by 1.0% agarose gel electrophoresis. A positive control can be also used for better results.

Appendix-I

COUNTING OF NPV/GV (POB/CAPSULE) USING IMPROVED NEUBAUER HAEMOCYTOMETER COUNTING CHAMBER.

A haemocytometer is used for estimating of NPVs/GVs in a unit volume of the product. The Improved Neubauer Haemocytometer comprised a thick glass slide with a shallow depression in the central section divided into two halves (figure-1). Each side, the base of the depression has a fine ruled grid of squares (figure-2) which is visible under a microscope. The dimensions of this grid are defined. Place a standard cover slip placed over the depression and a one half halves of the slide chamber using a micro pipette. The particles require 2-5 minutes to sediment to the chamber floor.

Either dark field or a phase contrast microscope is used to identify and count polyhedral occlusion bodies (POB) or capsule. With the counting chamber under the microscope, the number of Polyhedra/capsule in a given number of grid squares can be counted. Each count consists of a tally of the number of polyhedra completely contained within a big square plus the number of touching the top and left sides. Polyhedra touching the bottom and right sides are not counted. Since both the depth of the chamber and the grid dimensions are known. It is then a straight forward calculation to determine the number of polygedra /capsule per ml of test suspension.

$$\text{Number of NPV (POB) per ml/gm} = \frac{D \times X}{N \times K}$$

Where:

D = Dilution factor

X = Total number of polyhedra counted

N = Number of squares counted

K = Volume above one small square in $\text{cm}^3 = (2.5 \times 10^{-7} \text{cm}^3)$

Area of each small square is $1/400 \text{ mm}^2 = 0.0025 \text{ mm}^2$. Depth of chamber is 0.1mm. Volume of liquid above a single small square is $0.0025 \text{ mm}^2 \times 0.1 \text{ mm} = 0.00025 \text{ mm}^3$. To covert to cm^3 multiply by 1/1000 to get a volume of $2.5 \times 10^{-7} \text{ cm}^3$ above 1 small square. Hence, $K = 2.5 \times 10^{-7} \text{ cm}^3$

Worked example:

Suppose in a sample diluted by a factor of 1000 we count 535 polyhedra in 160 small squares then:

$$D = 1000$$

$$X = 535$$

$$N = 160$$

$$K = 2.5 \times 10^{-7} \text{ cm}^3$$

$$\text{Thus, POB count} = \frac{1000 \times 535}{160 \times 2.5 \times 10^{-7}} = 1.34 \times 10^{10} \text{ POB/ml of test sample}$$

- Note:** (i) Usually, this procedure is repeated 3 times and an average taken to get a more accurate estimate.
- (ii) Same procedure will be used for GV also for counting the number of capsule per unit volume of the product.

Bioassay for GV against *Chiloinfuscatellus*

Determination of LD₅₀:

To determine the LD₅₀ of the GVs, third instar larvae should be used. The larvae are to be microfed (one micro litre per larva) with six different doses, viz. 1.1×10^1 , 10^2 , 10^3 , 10^4 , 10^5 , and 10^6 IBs/larva. One hundred freshly moulted larvae have to be used for each treatment. Larvae fed with equal quantity of distilled water serve as control. The mortality has to be recorded daily. The LD₅₀ of the virus is determined following the probit analysis method (Finney, 1962).

LD₅₀ = < 1×10^3 OB for third instar larvae by micro-feeding.

Laboratory bioassay procedures for estimation of LC₅₀ of *Plutellaxylostella* (PxGV) by leaf disc method:

1. Cut leaf discs of cauliflower (3.2cm). Soak it in 0.1N NaOCI for 5 min. and wash thoroughly in distilled water. Air dry these leaf discs for 2-3 minutes. (Fifth leaf from top to be used)
2. PxGV (containing 0.01per cent Triton X 100) of different concentrations 28000, 2800, 280, 28, 2.8 OB/mm² on the leaf disc) is prepared
3. Aliquots of 12ul of each concentrating of GV is dispensed on the upper surface of the leaf disc and spread uniformly with a blunt end glass rod (use separate tips and glass rods for each treatment)
4. Air dry these leaf discs for 2-3 minutes
5. Repeat the same on the lower surface of the leaf disc.
6. Control discs were treated with distilled water containing 0.01 per cent Triton X 100 only.
7. The leaf discs are placed in Petri dishes lined with wet filter paper discs and 35-second instar larvae of *P. xylostella* (starved for 6 hours) are released on each leaf disc starting from control treatment to highest concentration. This is replicated three times.
8. Incubate these larvae at 25°C
9. After 24 hours remove the treated leaves (partially eaten) and provide the larvae with fresh cauliflower leaves.
10. The leaves are changed daily and mortality data recorded every day.
11. The dosage and time mortality responses are subjected to probit analysis.
12. If the mortality in the control excess 10% repeat the experiment.

LC₅₀ = < 0.15OB/mm² for second instar larvae by disc method.

Appendix-V

Laboratory bioassay procedures for estimation of LC₅₀ of *Achaea janata* Granulosis virus (AjGV) by leaf disc method:

1. Cut leaf discs of castor (8cm dia) and wash in distilled water. Air dry these leaf discs for 5 minutes.
2. Treat the leaf disc on both the upper and lower surfaces with 200 µl suspension of AjGV (containing 0.02% Tween-80) of different concentrations (5×10^8 , 5×10^7 , 5×10^6 , 5×10^5 , 5×10^4 corresponding to 19884, 1988, 198, 19, 1.9 OB per mm² on the leaf disc)
3. Aliquots of 100 µl of each concentration of GV is first dispensed on the upper surface of the leaf disc and spread uniformly with a blunt end of glass rod (use separate tips and glass rods for each treatment)
4. Air dry these leaf discs for 5 minutes
5. Repeat the same on the lower surface of leaf disc
6. Control leaf discs were treated with distilled water containing 0.02% Tween-80 only
7. The leaf discs are placed in Petri dishes (9.0cm dia) lined on wet filter paper discs and 35 second instar larvae (third day after hatching) of *A. janata* are released on each leaf disc starting from control treatment to highest concentration. This is replicated three times.
8. Incubate these larvae at 25°C.
9. After 24-48 hours remove the treated leaves (partially eaten) and provide the larvae with fresh castor leaves
10. The leaves are changed daily and mortality data recorded every day
11. The dosage and time mortality responses are subjected to probit analysis
12. If the mortality in the control exceeds 10% repeat the experiment.

Recommended LC₅₀ GV (*Achaea janata*) – LC₅₀ < 4 OB/mm² for second instar larvae by the leaf disc method.
