2.2	Presentation by Mr. Debabrata Biswas regarding compliance of the order dated 11.04.2022 passed by the Hon'ble Revisional Authority in revision petition no. 17 of 2021 filed by Mr. Debabrata Biswas vs CIB&RC and M/s VKA Polymer Pvt. Ltd., in respect of LLIN.
<p>With highest regard to the Appellate Authority's observations and in pursuance of the above-mentioned Order, RC provided an opportunity of hearing to M/s V.K.A. Polymers Pvt. Ltd, Karur on their application under Section 9(3B) for indigenous manufacture of Long-Lasting Insecticidal Net Incorporated with Alphacypermethrin 0.55% w/w & Mr. Debabrata Biswas by way of a presentation. M/s VKA Polymer Pvt. Ltd., while making its presentation submitted that they may be allowed to amend/convert their captioned application from Alphacypermethrin 0.55% w/w to Alphacypermethrin 0.58% w/w as they have generated the data on 0.58% w/w as data as conforming to ICMR protocol.</p> <p>M/s VKA Polymer Pvt. Ltd further submitted that in case the RC observe that there is some requirement of more/additional data, they undertake to submit the same to the satisfaction of RC. The submission of M/s VKA Polymer Pvt. Ltd., was opposed by the representative of Sh. Biswas and submitted that there is no provision under the Insecticides Act for amendment of an application/Form-I as requested by M/s VKA Polymer Pvt. Ltd., and therefore either the captioned application may be withdrawn or rejected. In addition, it was also submitted that M/s VKA Polymer Pvt. Ltd., may move a fresh application for Alphacypermethrin 0.58% w/w if he so desires.</p> <p>RC, reexamine the entire matter in view of the observations of the Appellate Authority and further in terms of presentation made by the parties.</p> <p>The RC after perusal of the agenda and hearing of the submissions of concerned parties is of prima facie view; that in the present context and in view of the contentions made and observations of Hon'ble Appellate Authority and therefore the captioned application of 0.55% regarding the grant of registration of Alphacypermethrin 0.55% w/w doesn't qualify for consideration as most of the data is generated on 0.58 percentage.</p> <p>RC also observed that in view of the explanation submitted by M/s VKA Polymer Pvt. Ltd., that they have already devoted a lot of time and money in the generation of data and had accordingly submitted the same on Chemistry, Packaging, Bioassay on 0.58 percentage as declared value of AI was 0.55% and observed Value was 0.58% or more whereas tox data has been generated on 0.55% w/w and the same was evaluated with declared value and observed value 0.55% w/w.</p>	

	RC thus observed and is of the view that M/s VKA Polymer Pvt. Ltd., is at liberty to submit a revised Form-I with the complete toxicology data on 0.58% especially in view of the fact that he had already submitted the data on Chemistry, Packaging, Bioassay on 0.58 percent as declared value of AI was 0.55% and observed Value was 0.58% or more whereas toxicity data was on 0.55% w/w.

Insects to be exposed for 30 minutes and then shifted to recovery chambers for 24 hours after which the mortality count should be made and the satisfactory mortality of insects would be more than 90%. The residual toxicity of insecticides should also be studied at different intervals. Evaluation of space spray against flying insects should be conducted in PEET GRADY Chamber as per **standard ISI specification 1824**, mats/coils could also be evaluated inside the Peet Grady Chambers against caged mosquitoes and the knock down effect is to be recorded at different intervals. Aerosols are to be evaluated inside a standard room. The test is to be conducted as per **WHO technical reports series No. 206**.

Documents to be mandatorily furnished by applicant applying u/s 9 (3)/ 9(3b) for all categories of bio pesticides

2. MOU/license agreement between the applicant and the inventor (either own R&D Laboratory or outsourced Research Institute/Facility) or Authorization letter from the inventor of strain OR undertaking by the applicant about the name of inventor/source of strain as per **Annexure-I**
3. Updated Stakeholder list for all members in Association/Organization claiming for MOU/authorization for data /technology utilization for mass multiplication/commercialization of the strain.
4. Relevant Affidavit/Undertakings: -
 - a) Affidavit on bio-pesticide composition on NJSP duly notarized.
 - b) Notarized copy of depositing microbial bio-pesticides strain sample in National Repository with reference code number.
 - c) Undertaking on NJSP duly notarized that product do not contain any genetically modified organism in the prescribed format.
 - d) Undertaking on NJSP duly notarized that product is free from chemical/botanical pesticides / other agro-chemicals.
 - e) Affidavit of strain Innovator or applicant
 - f) Copy of 9(3B) Registration certificate, if relevant

Note:

1. Bt products should be labelled with bio potency and (or) toxin content. In addition, the labels will have to contain a measurement of toxin protein as percent protein, referring to the Lepidopteran-active toxin(s) present in the crystal.
2. The presently used Bt var. kurstaki standard is HD-1-S-1980

and its potency was calculated at 16,000 IUs per milligram of powder (Beegle et al. 1986. Standardization of HD-1-S-1980: US Standard for Lepidopterous-active *Bacillus thuringiensis*. Bulletin Ent. Soc. America 32: 44-45.). This standard strain is now available with PDBC, Bangalore and DOR, Hyderabad.

3. Defined potency and toxin concentration - Bioassay would require the use of an insect species. Normally manufacturers could select *Trichoplusia ni* / *Helicoverpa armigera* for Lepidopteran specific Bt formulations. *Spodoptera* Units (SPU), *Leptinotarsa* Units (LTUs) or International Toxin Units (ITUs) are to be used for denoting a specific insect.
4. No test for beta exotoxin is required for *Bacillus sphaericus*, because this species is not known to produce exotoxins.
5. The biopotency of products based on *B. thuringiensis* subsp. *israelensis* (*Bti*) is compared against a reference strain IPS82, 1884 using early fourth-instar larvae of *Aedes aegypti* (strain Bora Bora). The toxicity of IPS82 has an arbitrarily assigned toxicity of 15,000 ITU/mg powder.
6. The biopotency of products based on *B. sphaericus* (*Bsh*) is determined against a reference standard SPH88, strain 2362 using early fourth-instar larvae of *Culex pipiens* (strain Montpellier). The toxicity of SPH88 has an arbitrarily assigned toxicity of 1,700 ITU/mg of the powder (Guidelines for laboratory and field testing of mosquito larvicides, WHO 2005 pp 45).
7. The use of alternative bacterial reference powders and / or strains must be approached cautiously. Such alternatives must be the subject of careful cross- calibration against the reference powders and should be conducted by recognized laboratories and should be made available to anyone who wishes to use, or check, the test with the alternative powders/strains.
8. Water content should not exceed 8 %, (12% in *Pseudomonas spp*) to preclude premature degradation of the product.

Guideline for already registered formulation/Strain u/s 9(3) under the IA, 1968.

1. In case of additional packaging endorsement applications, the data at Sl. No. 05, 06, 07 & 08, are not required if similar packaging (material) is being sought by the applicant as has been granted to earlier 9(3) registrant.
2. Specification of Bureau of Indian Standard (BIS) must be followed for all the packaging requirements (Wherever available and applicable).
3. All Packaging tests must be carried out with the product of same batch and in its commercial package preferably in Indian condition.
4. The duration of the test and the conditions including geographical conditions must be mentioned.
5. Storage stability data must be generated keeping at least the following parameters in test protocol viz., temperature, duration, test packaging material, content of active ingredient in the product, test humidity, exposure to light (if applicable), physical and chemical properties of the product during and after storage etc.

Besides this, the sub-committee also proposes the Guidelines on Consortium of Bio- pesticides.

Guidelines on Consortium of Bio-pesticides.

Efficiency of biocontrol agents could be increased by the development of mixture of compatible strains of different biocontrol organisms by considering the following norms. While developing a consortia formulation, the following needs to be addressed:

1. Compatible strains combination that differs in pattern of plant/site of colonization.
2. Compatible strains combination is broad spectrum of action against different plant pathogens.
3. Compatible strains combination with different modes of action under similar conditions.
4. Compatible strains combination of genetically diverse group to adapt to different pH, moisture, temperature and relative humidity.

The guidelines of Chemistry, Bio-efficacy, packaging for registration of consortia of Bio-pesticides are similar with the guidelines of Bio-pesticides except the following points.

Guidelines of mother culture/Primary culture of already registered bio-pesticides u/s 9(3) category are not required for registration of consortium Bio-pesticides. Only the guidelines of formulated product (Consortium) will be required. **Ratio of**

each strain in the formulation is required.

1. Following toxicology guidelines for consortia of Bio - pesticides is required.

Note:

- a. -Inhalation toxicity study required for registration of entomopathogenic/entomotoxic bacteria
- b. -Pulmonary toxicity study required for registration of antagonistic bacteria, antagonistic fungi, entomopathogenic fungi, baculovirus
- c. -Intraperitoneal toxicity study required for registration of antagonistic fungi, entomopathogenic fungi, antagonistic bacteria
- d. -Cell culture and Intravenous study required for registration of baculovirus. e and f - required for all except antagonistic fungi
- e. - required for all except entomopathogenic/entomotoxic bacteria

Note:-

- a. If genome sequence of conserved region of the microbial strains/microbes which are used in consortia of Bio-pesticides to be used as microbial pest control agent is identical with already registered strain, then data is not required for mother culture but data is required for combination/consortia from toxicity angle.
- b. If any new formulation of microbes is made by using new ingredients with different processes of manufacture than data is required for the formulation.
- c. If any new combination/consortia /Mixture of microbial strains/microbe developed from already registered microbial strain than data is required only for the mixture and not for mother cultures from toxicity angle.

Appendix-I

Bioassay for plant disease antagonists based on disease severity and root colonization.

The target pathogen to be tested against has to be grown in Sand maize medium. The Sand-maize medium is prepared by adding sand 90g, maize 10g. and water 10ml in a saline or any glass bottle of 300ml capacity and then autoclaved twice. Then 5 mycelial discs of the test pathogen are transferred into the bottle and left for incubation for 15 days. Once the culture has grown well, the sand maize medium is mixed along with the fungal growth and 1g from this preparation is used as the inoculum after adjusting the CFU to $1 \times 10^6/g$ by addition of sand.

The plastic cups (5-6 cm diameter) filled with soil and FYM (3:1) have to be used. In each cup the filling should be done upto $\frac{3}{4}$ th level. The pathogen inoculum is mixed with sand has to be applied upto 2cm depth in the plastic cups.

The bio-efficacy of the bio-agent shall be tested by both seed treatment and soil application. For seed treatment, the recommended dose of the formulation has to be used (5 to 10g.). For soil application, the bio-agent is added at the rate

of 1g of formulation (minimum CFU should be the 2×10^6). The germination percentage, disease intensity and seedling vigour are to be recorded.

Another set of plastic cups filled with sterile soil and sterile FYM has to be used to confirm whether the bio-efficacy was due to the isolate of the bio-agent tested or due to the native isolates of the bio-agent present in the soil.

The keys for grading the efficacy mentioned below shall be used (Srivastava et al., 2002). However, for the registration purpose, the bio-agents that are Highly Efficient, Efficient or Moderately Efficient in the plastic cup test under glass house condition (in the presence of pathogen) can be allowed (i.e.) germination percentage of 70% or above, disease incidence of 30% or less can be considered for registration.

Disease Grading Key

Disease incidence (%)	Description	Rating of bio-efficacy of bioagents
0	Germination >90%, no seed rotting, seedling healthy, root and shoot portions well developed	Highly Efficient (HE)
1-15	Germination 80-90%, infection on main as well as lateral roots, seedlings are well developed	Efficient (E)
16-30	Germination 70-80%, development of roots restricted and growth is less compared to Score 1. Infection occurred on roots. Shoot portions developed but growth retarded compared to Score 1.	Moderately Efficient (ME)

31-45	Germination 60-70%, length of roots and shoots short compared to Score 1. Germination of seeds inhibited. 50% of root area infected. Shoot portions also showed infection	Moderately Inefficient (MI)
46-60	Seed germination 50-60%. Development of roots and shoots greatly retarded. Shoot portions also showed infection.	Efficient (I)
Above 60	Less than 50% germination and seed rotting	Highly Inefficient (HI)

For the root colonization assay, the rhizosphere region of the plants tested above have to be collected and the soil adhering to the root surface has to be removed by gently tapping the roots. The root bits have to be cut into 1 cm bits and randomly 25 bits should be selected for each treatment. They have to be plated on (TSM) and the percentage of root bits colonized has to be recorded. This has to be performed in the sterile soil and non-sterile soil. One control treatment without the Biocontrol agent, being tested, should be kept for both the sterile and non-sterile soil to rule out of the possibility of interference of native micro flora in the bio- efficacy assay.

Bioassay procedure for *Plutella xylostella*

Various concentrations of *Beauveria bassiana* formulation ranging from 6 x 10⁸ to 2 x 10¹⁰ are to be screened to assess the mortality.

Fresh undamaged radish leaves free from pesticide application are to be collected and washed thoroughly in sterile distilled water and air-dried. Individual leaves are dipped in respective concentrations for 30 seconds. After complete drying of leaves ten late 2nd instar larvae of *Plutella xylostella* are released per treatment. A water dipped radish leaf is maintained simultaneously as control.

To prevent desiccation of leaves, the petiole is covered with a moist cotton swab. Each treated leaves are placed in a plastic container of dimension 12.5 x 10 cm containing moist filter

paper, Whatman No.41 to provide humidity.

Each treatment has to be replicated thrice. Fresh radish leaves were provided as feed at 24 hours interval. This set up has to be maintained at 25±1°C and 70-80% RH for 7 days. Observations on larval mortality are to be made at 3, 5 and 7 days after treatment.

Standard for LC₅₀ = Not more than 3 x 10⁹ cfu/g

Bioassay

Method Diet

incorporation

The following protocol is used for diet incorporation of oral toxicants to test their toxicity on target insects. The example presented here is to bioassay Cry I Ac on *H. Armigera* (First instar larva of other test insects are used for similar bioassay).

1. Pipette out 3 ml of the solution into a 40 ml plastic cup.
2. Pour lukewarm diet, approx. 60^o C, into the cup to a total volume of 30 ml. Place the lid and shake the cup vigorously for a minute to mix properly.
3. Pour the diet to 0.5 cm height, into wells of a 24-cell insect- rearing tray. Allow the diet to cool in laminar airflow under UV lamps for 1 h to surface sterilize the diet.
4. If concentration of the toxicant in the stock solution was 2 µg/ml, the final concentration in the diet would now be 0.2µg/ml diet. Thus the final concentration of toxin in diet was diluted 10-fold.
5. Release first instars into the diet rearing trays at the rate of one per well. Cover the diet tray with semi-permeable wrap and close the lid.
6. It is recommended that the lid be tightly secured to the tray with rubber bands, to prevent the larvae from escaping. Because the diet is unsuitable, larvae try constantly to escape from the diet rearing trays.
7. Keep controls with larvae released on untreated diet, for all the experiments.
8. The unused rearing trays with diet can be stored in a refrigerator for a week.
9. Change the diet for the larvae every two or three days.
10. Record mortality observations at 8 hourly intervals until the end of seven days, for median lethal time LT₅₀ calculations. LT₅₀ is the time at which 50 % of' the test

population is killed with the specific dose tested. A simple linear regression equation can be worked out to calculate the LT_{50}

11. Otherwise, record mortality at alternate days until the end of seven days, for median lethal concentration LC_{50} calculations. LC_{50} is the concentration that kills half the test population.
12. Record weights of surviving larvae at the end of seven days, for median effective concentration EC_{50} and LC_{50} is the concentration that prevents half the test population from reaching 50% of the weight attained by control larvae. For example, if the average weight of larvae on the control diet (without toxin) was 80 mg, EC_{50} represents the concentration at which 50% of the test population is unable to gain a weight more than 40 mg. LC_{50} is the concentration that inhibits half the test population from reaching the third instar.

Diet incorporation for filter paper bioassays

1. For bioassays with bollworms, 10 ml toxin incorporated diet is poured over a 16 sq cm piece of filter paper. The filter papers layered with diet are cooled and cut into smaller squares of 2 x 2 cm, and 10 first instar larvae are released in small plastic cups 3 x 3 cm (d x h) cups containing a square. Change the strips every alternate day.
2. Record mortality observations until the seventh day.

Surface coating of semi-synthetic diet

1. Prepare the diet and pour it into the trays or the rearing plastic cups. Generally, 10 μ l of the toxin can be used to coat 1 sq cm surface area. Gently swirl the diet surface to ensure uniform and complete spread of the solution over the diet surface.
2. Allow the surface to dry in a laminar airflow under UV light for 2-3 hours to surface sterilize.
3. Release one first instar *H. armigera* larva per well. Always maintain proper controls with untreated diet.
4. Change the diet on alternate days and record mortality until the seventh day. Then, weight of surviving larvae should be recorded on the final day of the bioassay.

The method has the advantage of obtaining constantly reliable results because the toxin is unlikely to be affected by either improper mixing or heat as can occur in the diet-incorporation method. Moreover, less amount of the toxin is required for the assay, compared to the diet- incorporation method.

Exotoxin determination by PCR studies

Methodology:

Some *Bacillus thuringiensis* strains secrete type I β- exotoxin, which is a non-specific insecticidal and thermostable adenine nucleoside oligosaccharide. Toxicity bioassays and HPLC are traditional methods for detecting β-exotoxin. For rapid approach for prediction of type I β-exotoxin production, PCR-based method can be followed as per Diego H Sauko et al. (2014). One of these ORFs encodes the Exo protein that was proved to be responsible for the phosphorylation of a β-exotoxin precursor at the last step of their biosynthesis process (Liu et al., 2010). Primers BEF (forward; 50- CGGCAGCCGTTTATTCAAA-30) and BER (reverse; 50- CCCCTTCCCATGGAGAAACA-30) amplify a 406-bp DNA fragment of thuE between nucleotides 373 and 778. All *B. thuringiensis* strains are grown on nutrient agar plates for 16h. A loopful of cells is

transferred to 100 µl H₂O and boiled for 10 min to make DNA accessible for PCR amplification. The lysate is centrifuged briefly (5 s at 20,000g), and 5 µl supernatant is used as a DNA template in each polymerase chain reaction. This is performed with a final volume of 25 µl containing 2.5 µl 10x reaction buffer, 0.5 µl 50 mM MgCl₂, 0.5 µl 100 mM deoxynucleoside triphosphate mixture, 8 pmol each primer, and 1 U of Taq polymerase (Invitrogen). The PCR amplification consisted of DNA denaturation at 94°C for 2 min followed by 25 cycles of amplification with a gradient thermocycler. Each cycle consisted of a denaturation step at 94°C for 1 min, an annealing step at 54°C for 1 min, and a chain elongation step at 72°C for 1 min. The final elongation step was extended for an additional 5 min. Subsequently, 10 µl PCR product is analysed by 1.0% agarose gel electrophoresis. A positive control can be also used for better results.

Appendix-I

COUNTING OF NPV/GV (POB/CAPSULE) USING IMPROVED NEUBAUER HAEMOCYTOMETER COUNTING CHAMBER.

A haemocytometer is used for estimating of NPVs/GVs in a unit volume of the product. The Improved Neubauer Haemocytometer comprised a thick glass slide with a shallow depression in the central section divided into two halves (figure-1). Each side, the base of the depression has a fine ruled grid of squares (figure-2) which is visible under a microscope. The dimensions of this grid are defined. Place a standard cover slip placed over the depression and a one half halves of the slide chamber using a micro pipette. The particles require 2-5 minutes to sediment to the chamber floor.

Either dark field or a phase contrast microscope is used to identify and count polyhedral occlusion bodies (POB) or capsule. With the counting chamber under the microscope, the number of Polyhedra/capsule in a given number of grid squares can be counted. Each count consists of a tally of the number of polyhedra completely contained within a big square plus the number of touching the top and left sides. Polyhedra touching the bottom and right sides are not counted. Since both the depth of the chamber and the grid dimensions are known. It is then a straight forward calculation to determine the number of polyhedra /capsule per ml of test suspension.

$$\text{Number of NPV (POB) per ml/gm} = \frac{D \times X}{N \times K}$$

Where:

D = Dilution factor

X = Total number of polyhedra

counted N = Number of squares

counted

K = Volume above one small square in $\text{cm}^3 = (2.5 \times 10^{-7} \text{cm}^3)$

Area of each small square is $1/400 \text{ mm}^2 = 0.0025 \text{ mm}^2$. Depth of chamber is 0.1mm. Volume of liquid above a single small square is $0.0025 \text{ mm}^2 \times 0.1\text{mm} = 0.00025 \text{ mm}^3$. To convert to cm^3 multiply by 1/1000 to get a volume of $2.5 \times 10^{-7} \text{ cm}^3$ above 1 small square. Hence, $K=2.5 \times 10^{-7} \text{cm}^3$

Worked example:

Suppose in a sample diluted by a factor of 1000 we count 535 polyhedra in 160 small squares then:

D = 1000

X = 535

N = 160

K = $2.5 \times 10^{-7} \text{ cm}^3$

$$1000 \times 535$$

Thus, POB count $= \frac{\text{-----}}{\text{sample}} = 1.34 \times 10^{10} \text{POB/ml}$ of test

$$160 \times 2.5 \times 10^{-7}$$

Note: (i) Usually, this procedure is repeated 3 times and an average taken to get a more accurate estimate.

(ii) Same procedure will be used for GV also for counting the number of capsule per unit volume of the product.

Bioassay for GV against *Chilo infuscatellus*

Determination of LD₅₀:

To determine the LD₅₀ of the GVs, third instar larvae should be used. The larvae are to be microfed (one micro litre per larva) with six different doses, viz. 1.1×10^1 , 10^2 , 10^3 , 10^4 , 10^5 , and 10^6 IBs/larva. One hundred freshly moulted larvae have to be used for each treatment. Larvae fed with equal quantity of distilled water serve as control. The mortality has to be recorded daily. The LD₅₀ of the virus is determined following the probit analysis method (Finney, 1962).

LD₅₀ = < 1×10^3 OB for third instar larvae by micro-feeding.

The terms used in the report are defined in APPENDIX- II

1. **Active ingredient:** The part of the product that provides the pesticidal action.
2. **Applicant:** The party (manufacturer, importer or their representative) that makes an application for registration of a pesticide to the responsible authority. (Please refer to Form-1 foot note under the Insecticide Rule 1971)
3. **Bio-pesticides :** Biopesticides is a generic term generally applied to a substance derived from nature, such as a microorganic or botanical or semiochemical that may be formulated and applied to control the pest and diseases.

- 4. Contaminant or impurity in MPCA:** Any microorganism or substances it produces that are present in a product, other than the specified microorganism (or substances it produces) of the microbial pest control agent (MPCA); an alternate/mutant form of the MPCA is considered to be a microorganism impurity.
- 5. Equivalence :** The determination of the identical similarity of the purity, impurity and toxicological profile as well as of the physical and chemical properties, presented by supposedly similar technical material originating from different manufacturers/place.
- 6. Formulation:** The combination of various ingredients in order to render the product useful and effective for the purpose claimed in the manner recommended.
- 7. Good Laboratory Practice (GLP):** A quality system concerned with the organizational process and the conditions under which non-clinical health and environmental safety studies are planned, performed, monitored, recorded, archived and reported.
- 8. Herbicide,** an agent, usually chemical, for killing or inhibiting the growth of unwanted plants, such as residential or agricultural weeds and invasive species.
- 9. Household pesticides** are commonly used indoors to control pests such as ants, cockroaches, houseflies, mosquitoes, fleas, ticks, bedbugs, termites, rodents, mites and microbes. ... Household pesticides may contain one or a combination of active ingredients of synthetic (chemical) or natural (plant or microorganism) origin.

10. **"Import"** means bringing into any place within the territories to which this Act extends from a place outside those territories;

11. **Infective or Infectivity:** The ability of a microorganism to invade and persist in a viable state and to multiply within or on an organism, with or without disease manifestation. The nature of an infection can vary widely with respect to severity, location and number of organisms involved

12. **"Insecticide" (Pesticide)** means - -

- i) Any substance specified in the Schedule; or
- ii) Such other substances (including fungicides and weedicides) as the Central Government may, after consultation with the Board, by notification in the Official Gazette, include in the Schedule from time to time; or
- iii) Any preparation containing any one or more of such substances.

13. **"Label"** means any written, printed or graphic matter on the immediate package and on every other covering in which the package is placed or packed and includes any written, printed or graphic matter accompanying the insecticide.

14. **"Manufacture"** in relation to any insecticide, include :-

- i) Any process or part of a process for making, altering, finishing, packing labeling, breaking up or otherwise treating or adopting any insecticide with a view to its sale, distribution or use but does not include the packing or breaking up of any insecticide in the ordinary course of retail business; and
- ii) Any process by which a preparation containing an insecticide is formulated.

- 15. "Package"** means a box, bottle, casket, tin, barrel, case, receptacle, sack, bag, wrapper or other thing in which an insecticide is placed or packed.
- 16. Pathogenicity:** The ability of a microorganism to cause disease and/or inflict damage on the host. Many pathogens cause disease by a combination of (i) toxicity and invasiveness or (ii) toxicity and colonizing ability. However, some invasive pathogens cause diseases that result from an abnormal reaction of the host's defense system.
- 17. Pesticide product:** The formulated product (pesticide active ingredient(s) and co-formulants) in the form in which it is packaged and sold.
- 18. Plant growth regulators** (PGRs) are chemicals used to modify plant growth such as increasing branching, suppressing shoot growth, increasing return bloom, removing excess fruit, or altering fruit maturity.
- 19. Plant extract/concentrate:** a botanical substance produced from the defined source(s) and by the described manufacturing processes, and which is the "active substance". For botanical active substances, the extract will be in most cases a mixture of components from the plant and in addition all components that result from the cultivation, harvest, post-harvest storage and primary processing and manufacturing. It may be difficult to identify and characterize all individual components. Some of these components may be considered as components of concern which may be considered in the same way as "relevant impurities" in chemical pesticide.
- 20. Post-harvest** :In agriculture, postharvest handling is the stage of crop production immediately following harvest, including cooling, cleaning, sorting and packing etc.

- 21. Public Health pesticides:** Pesticides that are used in the control of pests of public health significance under public health programs in the country.
- 22. Registration Dossier:** The set of data that is submitted by applicants, in a structured manner, in support of their application for registration. as per the requirements of the registration committee.
- 23. Semiochemicals :** Chemicals emitted by a plant or animal that evoke a behavioral or physiological response in another organism. When the semiochemical affects an individual of the same species, it is called a 'pheromone'. When it affects an individual of a different species, it is called 'allelochemical'.
- 24. Technical material :** Technical-grade materials and technical concentrates; also known as technical-grade active ingredient (TGAI).
- 25. Technical grade of MPCA:** Microbial material used for manufacture of microbial pest control products. It is the purest preparation of the MPCA resulting from a typical production process, and contains no additives except for purposes of MPCA growth or replication, or typical purification and preparation. It may be commercially distributed to manufacturers of microbial pest control products either in its pure form or augmented with preservatives, stabilizers, and diluents; or it may be a hypothetical stage in the manufacture of the microbial pest control product.
